-Introduction

Thank you so much for your interest in fostering kittens for Ruff Start Rescue. By opening up your home to foster kittens and pregnant cats, you're not only helping to save lives, you're providing the individual attention and care these kittens desperately need.

Kittens are some of the most at-risk pets because they require intensive around-the-clock care. Not only does fostering help kittens find forever families, it saves their lives and greatly decreases the number of cats and kittens who are killed in Minnesota shelters each year.

Foster homes are asked to provide care for the kittens and provide transportation to and from veterinary appointments as needed. Once the kittens are old enough (around 10 weeks) and weigh enough to be spayed or neutered (typically two pounds), you'll bring them to a Ruff Start Rescue Office surgery day or partner clinic to be spayed or neutered before they go to their forever homes. Care for foster kittens includes a strict feeding schedule, cleaning, and lots of snuggling and play time.

Although fostering kittens is a lot of work, it is a very rewarding experience. By participating in this program, you are saving lives and helping kittens find families. Through fostering, we can work together to work toward achieving our Mission- Ruff Start Rescue is dedicated to saving the lives of at-risk animals. We also collaborate, communicate, and educate about the importance of animal rescue and welfare and our Vision- We strive for a world where every companion animal has a safe and loving forever home.

FAQ's

What do foster families need to provide?

Foster families need to provide:

A healthy and safe environment for their foster kittens

Transportation to and from all vet appointments as needed and when ready to Adoption Events. We also can post for transportation help when needed on our Ruff Start Rescue Volunteers Facebook page.

Socialization and cuddle time to help teach the kittens about positive family and pet relationships

How much time do I need to spend with the kittens?

As much time as you can. The more time you spend with your foster kittens, the more socialized they will be to people. The amount of time required for bottle fed kittens will vary depending on the age of the kittens you are fostering. Very young kittens need to be bottle-fed every two to three hours, while older ones may be eating on their own and needing to be fed just a couple times a day.

Can I foster kittens even if I have a full-time job?

Yes. We can match you with kittens appropriate for your schedule.

How many kittens will I be fostering?

We like to have at least two kittens in a foster home so they can socialize with and learn from each other. Sometimes there are special circumstances in which a kitten goes to a foster home alone, but it's usually for a medical or behavioral reason.

How long will the kittens need to be in foster care?

Once a kitten weighs two pounds and is about 10 weeks old, he/she can be spayed or neutered and will then be ready for adoption.

What is my role before and after the kittens spay/neuter surgery?

You will need to set up the surgery date and location through your Foster Manager for the spay or neuter surgery for your kittens. Before and after care instructions will be emailed to you.

Will I need to give medicine to the foster kittens?

While we do our best to ensure that we are sending out healthy kittens to foster care, most illnesses have incubation periods, meaning that if the kittens picked up something at the shelter, symptoms can arise after you take them home. So, some kittens do not require any medicine, while others do. If your foster kittens need medication, we can show you how to administer it.

Can I let my foster kittens play with my personal pets?

Kittens are very susceptible to illness and can carry or catch dangerous ailments easily. For this reason, we require that foster parents isolate foster kittens with their own supplies for at least two weeks to try and ensure that the kittens are healthy prior to exposing them to your personal pets. We also advise that you consult with your veterinarian before fostering to ensure that all of your personal pets are healthy and up-to-date on all vaccines. If, for any reason, your personal pet becomes ill while you are fostering with Ruff Start Rescue, we cannot provide medical care for your personal pet. Never leave your personal pets unsupervised around the foster kittens.

Important note: If your personal cat is allowed outdoors, he or she cannot interact with your foster kittens. Kittens are very vulnerable to illness and we want to limit their risk by not exposing them to anything from the outdoors.

Will any of my foster kittens die?

Sadly, kittens are fragile, so it is always possible for them to become ill and pass away while in a foster home. This may be the hardest thing about fostering kittens. If it's something you don't want to encounter, then fostering kittens may not be the best fit for you. But please keep in mind that without foster homes, most of these kittens would not stand a chance of survival in a shelter. You're helping to save lives.

Who will take care of my foster kittens if I need to go out of town?

If you have travel plans while you are fostering kittens for Ruff Start Rescue, you will need to contact your Foster Manager and make arrangements for a temporary foster for the duration of the time that you are gone. Please provide as much notice as possible to ensure that we have an open foster for your kittens.

You cannot leave your foster cat with an unauthorized person or pet sitter. We have specific training for foster parents, and pet sitters have not undergone that training or signed the release waivers for the foster program.

What if I want to adopt one of my foster kittens?

If you want to adopt a foster kitten, you will need to complete an adoption application and follow the full adoption process. Let your Foster Manager know as soon as possible so we do not list them as available for adoption.

What if I know someone who's interested in adopting one of my foster kittens?

If someone you know is interested in adopting one of your foster kittens, please have them fill out an adoption application and contact your Foster Manager to let them know as soon as possible, because once the kittens are up for adoption, we cannot hold them for anyone. However, we do want to accommodate referrals from foster parents if we can.

Will it be difficult for me to say goodbye to my foster kittens?

Saying goodbye can be the most difficult part of fostering but remember that we always have more kittens who need wonderful foster homes. Keep in mind that by fostering these vulnerable pets, you are playing a crucial role in helping to save lives.

Section 2:

-Preparing for your foster kittens

Your foster kittens should be separated from all other animals in your household and kept in a small area, such as a spare room or bathroom, where they have access to their food, water and litter box. For young bottle fed kittens a clear Rubbermaid type tub works great to start out in. And because kittens cannot regulate their body temperature, this area should also be in a warm, draft-free area. It may be a good idea to consider an area that is easy to clean up in terms of spills and litter box accidents, which will happen since the kittens are learning. Please don't put the kittens in a garage or place that has outdoor access; those locations are not safe.

-Supplies you'll need

Ruff Start Rescue will provide you with any supplies that you may need. However, we greatly appreciate any help that you can provide in supplying items for your foster kittens. Here's what you'll need to care for your foster kittens:

- Gram scale
- At least one bowl for dry food and one for water: If you have a large litter, you will need to provide more than one bowl each for water and food.
- A supply of kitten food wet and dry
- New bottle for each bottle-fed litter and formula for bottle-feeding. Or syringes with nipple if that is your preferred method. (The Miracle Nipple is highly recommended but not required)
- Litter box with low sides: More than one may be needed for larger litters. A dish tub with a cut out area for entering and exiting works great.
- Non-clumping litter: Use pine pellets or clay litter. **Very critical that it be non-clumping!!!** Kittens will eat litter and clumping litter causes obstructions which can be fatal.
- Heat source: Kittens can't keep themselves warm, so you have to provide a heat source. The SnuggleSafe microwave heating pad is recommended.
- A soft place to sleep: Old towels or blankets work well.
- Toys: Use kitten-safe toys that are easy to sanitize and clean. Kittens can play with them when you're not home.

- Scratching post: Kittens need to learn to scratch on them rather than the furniture.

-Kitten-proofing your home

Foster kittens are tiny and cute, but just like children, they are also very curious. They will try to get into everything to explore, so you will need to kitten-proof your home. Here are some tips:

- Put away any small items that a kitten can swallow.
- Hide any breakable items, block electrical outlets and remove toxic plants.
- If your kittens are staying in a bathroom, make sure that the toilet lid is closed at all times.
- Block off any spaces that the kittens could crawl into and hide in.
- When setting up your kitten room, be sure to place the litter boxes as far away from food and water as possible.

Section 3:

-Scheduling appointments for your foster kittens

During the time that you foster kittens, you'll need to make a number of appointments — to take them in for vaccines and spay/neuter and pick up supplies. Please note that all appointments should be made through your Foster Manager.

-Picking up supplies

We have designated days and times that the office is open for supply pickups or we have supply houses located throughout the state. Please contact your Foster Manager for more details.

-Scheduling your kittens for spay/neuter

When your foster kittens weigh at least two pounds and is 10 weeks old they can be spayed or neutered. Contact your Foster Manager to start planning the scheduling 2-3 weeks in advance.

Section 4:

-Caring for your foster kittens

Because kittens are fragile, it is important for you to watch the behavior of your foster kittens closely and monitor their health daily. To keep track of their health, keep a journal of the kittens' weight, eating habits and overall health. You should weigh the kittens daily to ensure that they are growing and record the weight in the journal.

Watch for signs of illness, including frequent crying, restlessness, weakness, coldness (hypothermia), diarrhea, dehydration, shallow or labored breathing, paleness or blueness in the color of the gums. Notify your Foster Manager immediately if a kitten is losing weight, is cold to the touch, or is having trouble breathing (either shallow or heavy breathing).

Kittens are susceptible to illness, so foster kittens must be kept indoors. If your personal cat has access to the outdoors, he or she cannot interact with your foster kittens. Also, please do not let your foster kittens ride loose in a car. Use a carrier at all times to transport kittens to and from appointments.

-Caring for bottle-fed kittens

Bottle-feeding neonatal kittens requires an around-the-clock commitment. Thank you so much for offering your time and attention to these fragile babies. And please remember that we are here to support you. Here's some general info about bottle-feeding.

Milk preparation. You can pre-mix enough formula to last for 24 hours of feeding, but it must be refrigerated at all times. Discard all unused and mixed formula after 24 hours. Only heat enough formula for each feeding and throw away any uneaten warmed formula after each feeding. Do not re-use warmed formula because harmful bacteria can develop in it. You can use unflavored Pedialyte Electrolyte Solution instead of water if there is a dehydration concern.

Bottle-feeding tips. It is easier to feed your kittens when they are gently wrapped in a towel or blanket, instead of just using your hands. The towel or blanket is softer and warmer than your hands and being wrapped up makes the kittens feel safer as they eat. If the kitten allows it, the forelegs should be free to allow him to "knead" with his feet. This kneading activity is essential to the kitten's muscle development and helps aid in digestion of the kitten's food. Also, be careful to position the kitten so that his belly is toward the floor. To decrease the chance of formula being aspirated into the lungs, kittens should not be fed on their backs. Some fosters prefer a syringe with a nipple tip for feeding over a bottle.

Latching on. It may take a couple tries for a kitten to latch on to the bottle nipple. Just be patient; sometimes kittens need some encouragement to eat. Make sure that the nipple you are using on the bottle has an adequate flow of milk. When the nipple tip is punctured with a sterile needle or cut in an X, formula should drip out (one drop at a time, not a stream) when the bottle is inverted 180 degrees. Do not hesitate to contact your Foster Manager if you need any help or assistance with feeding your kittens. We are always here for you, ready to answer any questions that you may have.

Aspiration. If liquid bubbles out through the kitten's nose or he starts coughing, he may have gotten formula in his lungs. Pat the kitten very gently on the back to elicit a cough or sneeze, or hold him in an inverted position, tail overhead, for a moment to remove the formula from his lungs.

Burping. After each feeding gently rub and pat the kittens back to get any air they may have taken in during their feeding out.

Peeing and pooping. Bottle-fed kittens need help with elimination, so you'll need to stimulate your kittens to pee and poop. After you feed them, gently wipe each kitten's back end with a baby wipe or warm wet cotton ball or cotton pad to stimulate urination and defecation. Remember to do this every time after you feed them. Document the color and consistency in your journal. Kittens should urinate after every meal and should poop at least once a day and some will with every feeding. The normal color of kitten poop is various shades of mustard and the consistency is similar as well. When a kitten is first introduced to formula, it is normal for him or her not to poop for 48 hours.

Signs of illness. Watch for signs of illness, including frequent crying, restlessness, weakness, coldness (hypothermia), diarrhea, dehydration, shallow or labored breathing, paleness or blueness in color. Notify your Vetting Coordinator immediately if a kitten is losing weight, is cold to the touch, or is having trouble breathing (either shallow or heavy breathing).

Keeping kittens warm. When kittens are infants (less than two weeks old), they can be kept in small carriers or plastic bins that can easily be covered by a blanket to maintain heat and reduce draftiness. As they grow and become more mobile, they will need more space to roam and play. Also, don't forget that kittens cannot regulate their body temperatures, so please keep a SnuggleSafe disc warm and with them at all times. Because kittens' skin is very sensitive and prone to thermal burns, the warming disc must be covered by a blanket and puppy pad that the kittens cannot burrow under. A sock filled with rice and warmed in the microwave also works very well. Be very cautious if you are

using a heating pad. Make sure it is under the container (not inside) the kittens are kept in so there is no chance liquids can come in contact with it and also pay close attention to how warm it is so the kittens are not overheated. Make sure they have space that they can get away from the warm area if they are getting too warm.

Weighing. Please weigh the kittens at least once a day to ensure that they are growing and record the weights in the journal. Kittens should steadily gain weight daily. If it has been more than 2 days with no weight gain or weight loss contact your Foster Manager.

-How to bottle-feed kittens

Kittens will bottle-feed every two to four hours, depending on their age. Steps for bottle-feeding a kitten:

1. Warm the formula: Place the bottle in a bowl of hot water for a few minutes. Before feeding the kittens, always test the temperature of the formula by placing a few drops on your inner wrist to be sure it is not too hot. It should be slightly warmer than your body temperature.
2. Ensure that your foster kitten is warm before offering food. Do not attempt to feed a kitten who is chilled because it can have serious health consequences.
3. Wrap the kitten in a towel or blanket and position him so that his belly is toward the floor. Kittens should not be fed on their backs or in an upright position.
4. Turn the bottle upside down and allow a drop of formula to come out. Place the bottle nipple in the kitten's mouth and gently move it back and forth, holding the bottle at a 45-degree angle to keep air from getting into the kitten's stomach. This movement should encourage the kitten to start eating. If at first you don't succeed, wait a few minutes and try again. Usually the kitten will latch on and begin to suckle. If the bottle appears to be collapsing, gently remove the nipple from the kitten's mouth and let more air return to the bottle.
5. Burp the kitten – Instructions above
6. Potty the kitten- Instructions above

* A kitten's ideal body temperature is 100 to 102 degrees. If a kitten feels cold to the touch, contact your Foster Manager immediately. A kitten who is cold and unresponsive should be warmed right away. Place the kitten on an approved heating pad safely wrapped in two or three layers of towels. Turn the kitten side to side every 5 minutes. To stimulate blood flow, you may, ever so gently, massage the kitten with hand-rubbing. Or tuck the kitten into your shirt to use your body heat to warm it.

-Weaning kittens

Once your kittens are about four weeks old, it is time to start the weaning process. Your goal is to have the kittens eating on their own consistently by the time they're adopted. So, beginning at four weeks, start offering warm gruel (two parts wet food, one-part formula) at all times, along with dry kitten food and water. Every four to six hours, discard any uneaten gruel and provide a fresh batch.

You will still be supplementing the kittens with a bottle every eight hour once they start eating the food on their own to ensure that they are getting all the nutrients they need but encourage them to eat gruel before you offer a bottle. To get a kitten interested in trying the gruel, you may have to offer the gruel with a spoon or use your finger to place a small amount on the kitten's tongue. Ideally, by the end of five weeks, your foster kittens will be happily eating dry and wet food on their own. But some do take longer.

It is important to continue weighing your foster kittens every day at around the same time to ensure that they are always gaining weight. During the weaning stage, you should also begin introducing the kittens to the litter box because they should be able to eliminate on their own by about four weeks of age.

-Making formula

Mix two parts water with one part powder kitten formula. Mix the powder and water until all clumps are gone. Remember, mixed formula only lasts for 24 hours.

-Making gruel

Mix 2 parts wet food with 1 part formula. You can add a little water if the kittens seem to like a looser consistency. It's OK to make gruel in bulk and refrigerate it up to 24 hours, but you'll need to warm it before offering it to the kittens.

-Caring for independent eaters

By six to seven weeks old, your kittens should be independent eaters. Dry food and/or wet food should be their primary source of food. Replace the water in their water dish twice a day and sanitize the dish daily.

During this stage, your daily responsibilities include socializing the kittens and exposing them to new situations and environments. It's important to try and keep all experiences positive for the kittens, so give them lots of treats and toys as they learn about new sounds, smells, places and faces. See Section 7 for more tips on how to successfully socialize your kittens.

As always, watch the behavior of your kittens and monitor their health daily. Continue to keep a journal detailing each foster kitten's weight, appetite, energy level and overall health. Weigh the kittens once a day, preferably around the same time, to minimize the variables when tracking the kittens' growth. Look over each kitten every day for physical changes or potential medical problems.

Now that the kittens are using a litter box, be sure to scoop the box at least two times daily. Every other day, dump the litter, clean the box with a mild detergent (such as dishwashing liquid) or bleach wipes and put in fresh non-clumping litter. You'll want to monitor the kittens for diarrhea and clean the litter box more frequently if diarrhea is apparent. For more info on litter box training, see the appendix, and for details about instilling good litter box habits, see Section 7.

At this stage, play with the kittens several times a day with interactive toys. Play time provides stimulation, encourages socialization and releases excess energy. Try a variety of toys (balls, squeaky toys, feather toys, etc.) to see which ones your foster kittens like. Cat toys don't have to be fancy or expensive. Cats often enjoy playing with something as simple as a paper bag (remove the handles for safety) or a box with holes cut in the sides.

Don't leave your foster kittens alone with any toys that could be easily ingested or cause harm to them. Examples are string toys, yarn and Da Bird (feathers dangling from a string and wand). Toys such as ping-pong balls and toilet paper tubes are safe. Also, it may seem cute, but please discourage your foster kittens from play-biting your hands and feet. This is something that adopters may not find desirable.

-Cleaning up between litters

Once your kittens have gone to their adoptive homes, you must sanitize your fostering room or area before you can take home a new batch of kittens. Remove anything the kittens touched and clean it with a weak bleach solution, consisting of one-part bleach to 32 parts cold water.

If you have items that can be washed in the dishwasher, please do so since the heat will disinfect those items. Plastic or metal items that need to be sterilized, such as litter boxes or plastic toys, should be soaked in the bleach solution for 10

minutes and then rinsed off. Wash all bedding with bleach and hot water and throw away any toys that cannot be sterilized. Being conscientious about sterilization will help ensure that your next foster group will not catch any illnesses from the previous group of kittens.

You will need to offer fresh wet food 2 to 3 times daily.

-Quick Feeding Guide

kitten weight and feeding chart

AGE	WEIGHT	AMOUNT PER FEEDING	SCHEDULE
0-1 week	50-150 grams	2-6 ml	Every 2 hours
1-2 weeks	150-250 grams	6-10 ml	Every 2-3 hours
2-3 weeks	250-350 grams	10-14 ml	Every 3-4 hours
3-4 weeks	350-450 grams	14-18 ml	Every 4-5 hours
4-5 weeks	450-550 grams	18-22 ml	Every 5-6 hours
5-8 weeks	550-850 grams	(weaning; offer ample wet food)	Every 6 hours

You'll notice that as the kitten gets older, the amount increases and frequency decreases. Use your judgment to adjust as necessary; for instance, if a kitten is eating less at each feeding, you may want to increase the frequency. Meet the kittens where they are.

Section 5:

-Fostering moms with kittens

Mother cats, also known as "queens," need to be in a calm environment so that they can be stress-free and feel like they are keeping their kittens safe. Sometimes, stress can cause a mother cat to become aggressive or to not care for her babies properly. With that in mind, choose a private and quiet room of your home, away from the daily activities of your family, in which to situate the mother cat and her kittens.

It's also important that they be kept away from other pets in the home. Other pets can be perceived as a threat by the mother cat and cause her to act aggressively to protect her young. If you have children and an active home, it may be best to foster when the kittens are four weeks or older. Sometimes mother cats will behave less defensively if their kittens are older.

-Bringing everyone home

Set up your fostering room before you bring the pregnant cat or mother cat and her kittens home. You should put the litter box as far away from the mother cat's food and water bowls as possible and provide a couple of different safe

places where she can care for her kittens. A dark area equipped with a whelping box is ideal. A very large cardboard box with a large enough entrance cut out for changing bedding is perfect.

A whelping box is a box that is large enough for the mother cat to lie on her side slightly away from her kittens with all of the kittens in the box with her. The box should have sides high enough to prevent the kittens from wandering away, but low enough so it's easy for the mother cat to come and go as she needs to. Lining the bottom of the box with puppy pads topped with an easy-to-clean blanket or towel on top of the absorbent materials to give the mother cat and kittens a soft place to lie on. Please keep all these materials dry so that the kittens are not chilled by dampness. Do not place straw, hay or shavings in the area where the mother and kittens are kept. Change out the puppy pad and towel daily. A clean sanitary environment is critical to the health of the kittens.

When you bring your foster kittens and their mom home, put them all in the fostering room and close the door, allowing the mom to explore on her own. Give her a couple of hours before you enter her room and don't be alarmed if it takes a few days for her to stop hiding.

-Mom's care of her kittens

The momma cat should take care of her kittens by herself for at least three to four weeks before she starts the weaning process for her babies. Each momma cat that you foster will be slightly different in her level of attentiveness, but there are three basic stages of nursing (see below). If for any reason your momma cat is not performing one of the listed functions, please notify your Foster Manager right away to evaluate whether the mom has a medical concern that we need to address.

Kittens are born blind, but they can feel their mother's heat and seek her out to begin nursing within two hours of being born. Mother cats should be lying on their sides to ensure that their kittens can find the nipples for nursing. Here are three stages of nursing:

One to two weeks old: The mother cat initiates nursing by licking her kittens to wake them up and curling her body around them. After she wakes all of her babies, the kittens search for a short time period and then quickly latch on.

Two to three weeks old: The kittens' eyes and ears begin to function and they start to explore beyond the nesting area. This is when the kittens start interacting and playing with their mother. At this age, the kittens start to initiate some of the nursing and momma should comply by lying in the nursing position.

Four to five weeks old: The kittens begin weaning and, in turn, the mother cat no longer initiates any nursing. If the mother cat still allows the kittens to nurse, it will be initiated by the kittens and can be lateral or upright nursing.

Occasionally, mom cats develop mastitis when their kittens stop nursing and begin to eat on their own. Mastitis occurs when the mammary glands inflame and harden, creating a very painful infection for the mother cat and causing symptoms such as a fever and listlessness. If you think your mother cat may have mastitis, call your Foster Manager on the next business day. This is not an emergency condition but will require treatment.

The mother cat will groom and lick her babies frequently for the first two to four weeks. She will stimulate her kittens to pee and poop and will generally consume the fecal matter and urine. As the babies become more mobile, they will start to leave the nest and deposit urine and feces nearby, which is a good time to start introducing a couple of low-sided litter boxes.

To ensure that the mother cat has enough to eat, give her access to both wet and dry kitten food at all times. Food intake for a nursing mother can be two to four times the amount eaten by a cat who's not nursing. Kitten food is higher in calories and essential for a healthy pregnant and nursing queen.

When fostering a momma cat, it is very important to observe her behavior daily and watch her interactions with her kittens to spot any problems. Unfortunately, 8 percent of kittens pass away because of inadequate maternal care. This can happen for many different reasons, some of which are beyond our control.

-Problem behaviors in momma cats

Here are some details about problem behaviors in momma cats and what you can do about them.

Maternal neglect. Sometimes a mother cat stops providing care to one or all of her kittens. The neglect may be because of a birth defect or weakness in the kitten; she may just be trying to follow nature's course, focusing her attention on the stronger kittens. Neglect may also happen because she is inexperienced or she's in a stressful environment. Either way, that's why it's so important to make daily observations to ensure that she is caring for her babies. If she will let you handle the kittens, you should weigh each kitten once a day to ensure that they are gaining weight. If you notice that she is spending all of her time away from the kittens, is not grooming or nursing them frequently, or doesn't respond to their cries, please call your Foster Manager right away.

Maternal aggression toward other animals. Aggressive behavior directed at other animals is common and expected from mother cats because they have a maternal instinct to protect their young at all times. With that in mind, please do not try to introduce her to the other animals in your home. As mentioned above, the mom cat and her kittens should have a quiet room of their own away from all other pets so that she and her babies can always feel safe. If she has seen another animal and becomes stressed or aggressive, it is very important to leave her alone and not try to comfort her. Give her 20 minutes or so to calm down and then check on her.

Maternal aggression toward people. Sometimes mother cats will act aggressively toward people. These behaviors may include hissing, growling, swatting and biting. Again, the mother is merely trying to protect her young. We evaluate mom cats for these behaviors before sending them into foster homes, but sometimes the behaviors develop later. If you have a mother exhibiting these behaviors, do not try to "correct" the behavior with a spray bottle or any type of punishment. She is only acting out of instinct to protect her babies and you could cause her aggressive behavior to escalate.

Contact the Foster Manager at the first sign of any of the above behaviors so we can assess the situation and decide on the safest option for momma and her babies.

-Separating kittens and moms

If all of your foster animals, mom included, are healthy and friendly, we have no reason to separate mom from kittens before they are ten weeks old. But there are a few medical or behavioral reasons for separating them earlier than ten weeks:

As mentioned above, if the mother cat is showing signs of maternal neglect and is no longer caring for her kittens, we may decide to separate her from her kittens.

If the mother cat is semi-feral or very under socialized, we may decide to separate the kittens once they are eating on their own consistently and no longer need to nurse (around four to five weeks old). Separating them would prevent the kittens from learning feral behaviors from their mother and help them to become socialized, which increases their chances of finding forever homes.

If there is a medical concern about the mom or babies, a veterinarian could make the decision to separate the kittens from the mother cat.

The kittens' best chance at survival is to stay with their mom. Please do not separate your foster kittens from their mom for any reason, or attempt to supplement the mother's milk with formula, without consulting us first.

Mother cats need to have their milk supply dried up before Spay surgery. The surgery either needs to be scheduled 2 weeks after the kittens go to their new homes if mom has not fully weaned them or she will need to be separated from them. Even though kittens don't need to nurse anymore if mom lets them they will often continue to. It is best that the kittens are with their mom for the full 10 weeks so it's easiest to schedule her surgery after they have left. Or she needs to be separated from them until her milk supply dries up and then also after the surgery so they don't try to nurse and irritate the spay incision.

Section 6:

-Medical Protocols

You are responsible for scheduling appointments for your kittens' vaccines on or around the due dates indicated by your Foster Manager. Vaccines are given starting at 5 to 6 weeks old and every 3-4 weeks afterward until they are adopted. To schedule appointments for vaccines, email your Foster Manager. Worming is done every 2 weeks.

If you are fostering a group of kittens on medications, please ensure that your kittens get all prescribed doses. Do not end medication early for any reason.

-Veterinary care

Ruff Start Rescue provides all medical care for our foster animals at our approved veterinary clinics or some routine things can be done. Because we are ultimately responsible for your foster animals' well-being, our staff must authorize any and all treatment for foster animals at our approved veterinary partners.

If your foster kittens need to go to the veterinarian, please notify your Foster Manager. The Foster Manager will submit approval which is required for your veterinary appointment or help to schedule you at the office.

For non-emergency situations, please understand that our veterinary partners book quickly and may not be available for same-day appointments. We ask that you schedule basic non-emergency appointments at least a week in advance.

Remember, foster parents will be responsible for payment of any medical care if they take their foster animal to a veterinarian without authorization from the Foster Manager.

-Signs of illness and what to do next

Kittens do a good job of masking when they don't feel well, so determining if a foster kitten is under the weather will require diligent observation of the kittens' daily activity and appetite levels. Be aware that kittens act differently at different ages. For example, a healthy two-week-old kitten will sleep often and get up only to nurse, whereas a healthy six-week-old kitten should have a lot of energy. If you have any questions about the health of your foster kittens, please contact the Foster Manager who will be happy to answer any questions that you may have.

Eye discharge. It is normal for kittens to have some discharge from their eyes when they wake up. But if a kitten has yellow or green discharge or swelling around the eyes (making it hard for him to open his eyes), or the third eyelid is showing, you need to contact your Foster Manager to get antibiotic eye ointment.

Sneezing and nasal discharge. Occasional sneezing is common in kittens. If the sneezing becomes more frequent, examine the discharge coming from the sneeze. If the discharge is clear, the infection is probably viral and medication may not be necessary. But it is important to monitor the kittens in case the problem becomes worse. If the discharge becomes colored or has blood, contact your Foster Manager to schedule a vet appointment because the kittens may have a bacterial infection. Be sure to monitor the kittens' breathing. If they start to breathe with an open mouth or wheeze, call your Foster Manager immediately. Also, once you notice nasal discharge, monitor the kittens' eating habits more closely to ensure that they are still eating. And, of course, continue to weigh them daily. Viral kitten colds can take a couple of weeks to clear up just like a human cold.

Loss of appetite. Your foster kittens may be stressed after arriving in your home, and stress can cause lack of appetite. Unwillingness to eat in kittens can be very serious, so pay close attention to whether the kittens are eating. Kittens should eat on a two- to eight-hour schedule, depending on their age. If a kitten under four weeks old misses two meals or a kitten over four weeks of age goes more than 12 hours without eating, your Foster Manager should be contacted. Also, if a kitten less than eight weeks old does not urinate for over 12 hours, contact your Foster Manager.

Lethargy. The activity level of your kittens will vary with each kitten in your litter and with age. Sick kittens may have lower energy levels and just want to sit in your lap or on the floor and not move much or play. If you notice a drop in your foster kittens' energy level, please contact your Foster Manager. If a kitten cannot be roused or seems weak and unable to stand, this is an emergency and contact your Foster Manager. Note: Some under socialized kittens will move less because they are frightened. If you have a fearful group of kittens, it can be more difficult to determine if their energy levels are low.

Dehydration. Dehydration is usually associated with diarrhea, vomiting and/or loss of appetite. To test for dehydration, gently pinch the kitten's skin around the scruff area. If the skin stays taut, the kitten is dehydrated. Please contact your Foster Manager.

Vomiting. If a foster kitten has thrown up two or more times in one day, please notify your Foster Manager. If there is blood in the vomit, please call right away.

Pain or strain while urinating. When kittens first go into a foster home, they may not urinate due to stress. If a kitten hasn't urinated in more than 24 hours, however, please contact your Foster Manager. Also, if you notice the kitten straining to urinate with little or no results, or crying out when urinating, please contact your Foster Manager immediately because it may be indicative of an infection or a urethral obstruction, which can be life-threatening.

Diarrhea. In kittens, it can be tricky to determine if diarrhea is a problem. Soft stool diarrhea, most likely caused by stress, is normal for the first two days after you take kittens home. Kittens who are nursing tend to have loose stool, but if it is watery or very large in volume, that's a concern. By the time kittens are five weeks old and are eating consistently on their own, they should have firm, normal stool. If your foster kittens have liquid stool, please contact your Foster Manager so that a vet appointment can be scheduled; the kittens may need medication.

Once your kittens are using a litter box, please monitor the box daily. Remember that diarrhea will dehydrate your kittens, so be proactive if you notice any diarrhea. If a kitten has bloody or mucoid diarrhea, please contact your Foster Manager.

Frequent ear scratching. A foster kitten may have ear mites if she scratches her ears often and/or shakes her head frequently, or if you see a dark discharge that resembles coffee grounds when you look in her ears. Ear mites can be easily treated, so please contact your Foster Manager.

Hair loss. Please contact your Foster Manager if you notice any hair loss on your foster kittens. It is normal for cats to have thin fur around the lips, eyelids and in front of the ears, but clumpy patches of hair loss or thinning hair can indicate ringworm or dermatitis. It is important to check your foster kittens' coats on a regular basis.

-Serious kitten ailments

Kittens are susceptible to these illnesses:

Fading kitten syndrome: Symptoms include unwillingness to eat, dehydration, lethargy, weight loss, coldness to the touch, and difficulty with breathing or labored breathing.

Panleukopenia (feline distemper): Symptoms include unwillingness to eat, vomiting, diarrhea and/or dehydration. The diarrhea often has a mucoid texture and/or is bloody.

If a kitten is displaying any combination of the symptoms listed above, please contact your Vetting Coordinator. These ailments can be fatal if left untreated.

-Criteria for emergencies: Please see below for signs of emergency concerns and who to contact.

LEVELS OF EMERGENCY For Ruff Start fosters

RED: Contact Immediately

Monday- Friday 8am-5pm: Email
vetting@ruffstartrescue.org and cc foster
manager with subject line as "URGENT"

Weekends and Evenings:
Call emergency
line at 763-334-5241

- Straining to urinate, blood in urine (male cats only)
- Not eating or vomiting for more than 24 hours (puppy or kitten only)
- Laceration needing stitches
- Lost foster dog or cat
- Dog/cat bite, broken skin
- Bleeding profusely
- Having trouble breathing
- Unresponsive
- Ingested a dangerous item
- Unable to stand or walk
- Seizure, disoriented

GREEN: Email is fine

Email your concerns to your foster manager. These concerns can wait until open business hours of Monday-Friday 8am-5pm

- Limping
- One or few episodes of vomiting or diarrhea
- Itchy skin
- Watery, goopy eyes
- Dirty, stinky ears
- Coughing
- Broken nail
- Hot spot, skin irritation
- Visible worms in poop
- Diarrhea for less than 24 hours
- Chewed or removed sutures, staples

Section 7:

-Socializing and instilling good behaviors in kittens

Your goal as a foster parent is to prepare your foster kittens for forever homes. While a big part of that is helping the kittens to grow and be healthy, another component is helping them develop the good habits that will make them wonderful companions for their adopters.

-Establishing good litter box habits

Start introducing your kittens to the litter box around the age of four to five weeks. Make sure the litter box you are using has low sides or a cut out low area, to make it easy for the kittens to climb in and out. Keep kittens confined to a small area with non-absorbent flooring like linoleum and have at least one litter box for every 2-3 kittens. You can encourage the kittens to use the bathroom facilities by gently returning them to their litter box every 15–20 minutes while they're playing or right after eating.

You also want to make sure that you are scooping the litter box at least twice a day, more if you have a large litter or they have diarrhea. You will also need to dump the litter box entirely every two to three days and clean with dish soap or bleach wipes. A clean litter box will promote good bathroom habits for the kittens going forward. If your foster kittens are not using the litter box, please notify the Foster Manager so you can start resolving the issue before it becomes a habit.

Oftentimes, kittens miss the litter box when they are learning or if they have medical issues like diarrhea, or if they have too much free space, causing them to forget where the box is when they have to go. Clean all accidents with a sanitizing cleaner and don't ever punish a kitten for having an accident. Just like potty training a child it takes them a little while to get the hang of it and they will have some accidents.

For more info about litter box training, see the appendix.

-Discipline

One of your goals as a foster parent is to help prepare your foster kittens for living successfully in a home. So, we ask that you help your foster kittens to develop good habits and skills through the use of positive reinforcement, which builds a bond of trust between you and your foster pets. The basic idea is to reward desirable behaviors and ignore unwanted behaviors.

You must not punish the kittens for behavior that you find undesirable because punishment is ineffective at eliminating the behavior. If a kitten is doing something undesirable, distract him or her before the behavior occurs. It is also important for every human in the foster home to stick to the rules established for your foster pets, which will help them to learn faster.

-Play time

Play time is a very important part of kitten development. It is crucial for young kittens to have other kittens to wrestle with in order to develop appropriate play skills and be properly socialized with other kittens. Kittens also need toys to

play with so that they can get physical exercise and mental stimulation. There are two types of toys that help with kitten development:

Solo toys are things the kittens can play with when you aren't there. These toys should be easy to clean and impossible for the kittens to consume. Examples are ping pong balls, toilet paper tubes, bottle corks and plastic shower curtain rings.

Interactive toys are things that you use to engage the kittens in play. Examples are Da Bird (a feather dangling from a string) and other toys with yarn or string attached. Don't leave kittens alone with these toys, since they can easily strangle or be ingested by the kittens.

During play time, it is always important to discourage kittens from biting your hands and feet. It may seem cute, but we want to avoid teaching kittens a habit that adopters may find undesirable.

-Socializing and handling

Introducing your foster kittens to new things and new experiences will also help prepare them for living happily in forever homes. Follow these rules to positively expose your kittens to new people, environments and noises:

New people: Introducing your foster animals to new people will help them become well-adjusted adult cats. Monitor all interactions with new people, though, to ensure that they are positive, not scary, experiences for the kittens. Have new people give gentle pets and treats to the kittens and interact with them using fun toys. If children are visiting, they must always be supervised until they are old enough to understand how to gently interact with a kitten.

New environments: It will help the kittens' adjustment into adopters' homes if you can allow your kittens to experience different parts of your home. Whenever you introduce the kittens to a new space, provide lots of treats and play with interactive toys so that the kittens associate the new space with their favorite things. Keep the exploratory sessions brief so you don't overwhelm your kittens and return them to their living space if they do seem overwhelmed or scared.

New noises: It is beneficial to expose kittens to a variety of normal household noises but, again, try to do it in a positive way. The key is to introduce different noises gradually. For example, start by keeping a radio on low volume and gradually increase the volume over a few days. Another example: Run the vacuum in another room at first, with your kittens at a safe distance. Then, over the course of a few days, move the vacuum noise closer to their room. If another person plays with the kittens while you make the noise, it may help alleviate any stress or fear that they may feel. Some kittens are naturally fearful, so just go even slower with the timid ones.

Another thing you can work on with your foster kittens is getting them comfortable with being in a cat carrier. When you are not using the carrier for transportation, leave the carrier (with the door removed or securely propped open) in your foster kittens' room. Put toys, treats and a soft blanket in the carrier, to encourage the kittens to go in and spend time there.

-Schedule for successful socialization

If your foster kittens are not socialized at all when you bring them home, you'll need to have a more focused socialization plan. Remember, keep all experiences positive for the kittens.

Days 1–7: Your foster kittens may be hissing, swatting, spitting and/or growling.

Activities to engage in:

“Burrito-wrapping” the kitten in a blanket or towel: Use gloves and a towel to handle the kitten if needed.

Hand-feeding: Feed the kittens dabs of baby food (protein only, with no onion or garlic on the ingredients list) or canned tuna by hand.

Picking up and returning: Repeatedly pick up each kitten and return him/her to their safe space.

Playing: Try engaging the kittens in play with interactive toys.

Days 7–14: The kittens may hiss when you approach but respond to touching and petting.

Activities to engage in:

Handling: Continue handling and petting the kittens. If improvement is shown, try to move to handling other body parts, but do not go too fast.

More playing: Start standing and walking around while playing with the kittens, to get them used to normal human movement.

More hand-feeding: Give the kittens treats while you handle them, to help them learn that you are not a threat.

After 14 days: Your kittens may still be shy but should be more comfortable with you approaching them and should no longer display defensive aggression behaviors. If your kittens do not show improvement at all after two weeks of attempts at socialization, please contact the foster department for guidance.

Appendix

Guiding your foster kittens’ behavior

Kittens need to be socialized to interact appropriately with both humans and other cats. When you socialize kittens to humans, you’re helping to create happy, healthy adult cats who will make wonderful pets. That’s why it’s so important to handle, talk to and play with your foster kittens.

Well-socialized mother cats are more likely to have well-socialized kittens. The kittens will pick up on whether their mother is calm or fearful around people. If there is no mother cat, kittens can still learn from their littermates. Play helps to increase social, coordination and learning skills.

A healthy mother-kitten relationship

A mother’s direct interaction with her kittens includes the “brrp” or chirping calls she makes as she approaches them, as well as nuzzling and licking them to awaken them and to stimulate urination and defecation.

Initially, the kitten’s activities are restricted to crawling along the mother’s body and nuzzling against her to locate a nipple, often in competition with litter mates. The kittens suckle, lie still by the mother, move around near her and call out to her.

A call frequently given by the kittens is the cry associated with distress. It is given when a kitten awakens and is hungry, when a kitten's movement is restricted (e.g., the kitten is trapped under the mother) or he becomes isolated and cold. The mother should answer the call.

Suckling is accompanied by kneading against the mother's abdomen. It is thought that these kneading movements stimulate the mother's milk flow, help to develop the kitten's muscles and aid in digestion. The kittens may initially spend about eight hours a day suckling, but this activity decreases as they grow older.

As the kittens become older and more mobile, they become increasingly responsible for approaching the mother and initiating suckling. In the later stages of the weaning period (at about seven weeks old), the kittens become almost wholly responsible for initiating suckling. The mother may actively impede these efforts by blocking access to her nipples or by removing herself from the kittens' proximity.

If you notice that the mother cat is neglecting her kittens inappropriately or showing any other negative behaviors mentioned in this manual, please contact the Kitten Case Manager.

Kitten development and what you can do

Time and effort are required to properly socialize kittens. In fact, when they're between four and twelve weeks old, daily socialization sessions are important in shaping the kitten's personality and emotional growth.

You'll want your foster kittens to become familiar with having their paws touched (front and back), their mouths opened and their ears touched. Combining this type of handling with regular grooming sessions and body massages helps to prevent skin sensitivity or aversion to touch. And acquainting kittens with a variety of sights, sounds and textures will help them to grow into well-socialized adult cats. Listed below are some characteristics of kittens at different stages and the steps you can take to help socialize them.

Newborn

Appearance: Newborn kittens should be pink, firm, plump and generally healthy-looking.

Temperature: Normal rectal temperature for newborns is 96 or 97 degrees Fahrenheit.

Eyes and ears: Closed, but they can still hear (though poorly) and respond to bright light with a blink reflex.

Muscles: Healthy kittens will curl their bodies and limbs inward.

1 to 2 weeks

Temperature: Normal rectal temperature has gradually increased to 100 degrees F.

Eyes and ears: Open at approximately 11-15 days.

Muscles: Kittens can use their front legs to stand and walk shakily.

What you can do: You can engage in gentle handling and cuddling at this point. These sessions should be very short (one to two minutes), and great care should be taken in the handling process. Rub the hair coat gently with your hands, and gently finger the webbing in between the toes. Rub the ears and muzzle.

2 to 3 weeks

Temperature: Kittens are able to maintain their own body temperature within the normal range (100.5 – 102.5 degrees F).

Eyes: Vision is initially poor, even after the eyes have opened, but continues to develop until three to four weeks of age. If the eyes fail to open and the lids look sticky, wipe the lids very gently with dampened cotton lightly smeared with a little petroleum jelly to ease their opening. The eyelids should never be pulled apart. If a kitten's eyelids still haven't opened by 14 days, contact your Vetting Coordinator.

Muscles: The rear legs can now support the body. Kittens are crawling.

Teeth: Deciduous incisors start to appear, followed by deciduous canines.

What you can do:

Provide the kittens with a whelping box area for sleeping and another area, away from the sleeping and feeding area, that contains the litter box.

Provide five minutes of handling exercises. Gently roll the kitten over on her back for 5-10 seconds, and then draw her close to you, stroking and cuddling her. Never do this while actively feeding the kitten. Be careful not to startle the kitten with sudden movements or loud sounds.

Start grooming: Softly and gently brush the kitten's coat with a few strokes, touch the ears and mouth, and start clipping the kittens nails so they get used to having this done on a regular basis.

3 to 4 weeks

Eyes and ears: Vision and hearing are normal. Blink response disappears with the development of accurate pupil control. The kitten is now able to use visual clues to locate and approach the mother. The eyes should be completely open by 17 days.

Muscles: By 21 days, kittens can walk with a fairly steady gait. They can also sit and have reasonable control of their toes.

Teeth: Deciduous incisors and canine teeth continue to come in.

What you can do:

If the mother and kittens are no longer using the whelping box, it's OK to remove it.

At about four weeks old, the kittens will begin to eliminate on their own. This is a good time to introduce additional litter boxes. Use boxes with low edges so that the kittens can easily climb in and out. Only use non-clumping litter, since kittens often try to eat the litter when they are learning.

The kittens will start to explore their immediate environment. Provide safe, simple toys to help stimulate them.

The kittens can be introduced to other people at this time, but this interaction should be carefully controlled. The interaction should be limited to five minutes of time spent in gentle massage and cuddling.

As the main caregiver, you should continue the grooming and handling exercises: holding, cuddling and stroking each kitten's body, including ears, tail and muzzle.

4 to 5 weeks

Eyes and ears: Vision is markedly improved. From three to five weeks, kittens learn guided paw placement and obstacle avoidance.

Muscles: Kittens are walking normally and start climbing. Social play is prevalent.

Teeth: Deciduous premolars come in.

What you can do: Continue the handling and socialization exercises.

5 to 8 weeks of age

Temperature: Normal range is 100.5 degrees to 102.5 degrees F.

Teeth: Kittens have an entire set of deciduous teeth by five to six weeks of age.

What you can do:

The kittens are totally dependent on the environment you provide to stimulate and develop them. Play with objects increases around seven to eight weeks of age, so continue to add appropriate toys to the kittens' environment.

Introduce the kittens to as many different people as possible — people of different shapes, sizes, colors, sexes and ages. Encourage the kittens to allow individual handling by different people: men, women and supervised children. Keep the visits short.

Expose the kittens to mild sounds, different areas and surfaces, allowing them to investigate.

As the main caregiver, you should continue the handling and grooming exercises.

If you choose to, you can introduce the kittens to other animals while their mother is not around. Keep the visits very short and always supervise them. These visits should be calm and pleasant; a traumatic incident at this stage could have a lasting effect on the kittens. Keep in mind that kittens can carry diseases that can be transmitted to other animals.

8 weeks or older

What you can do:

Protect the kittens from unpleasant or negative experiences. The kittens' environment should be designed to help them develop a sense of security.

Continue to introduce the kittens to as many different people as possible.

Continue the handling and grooming exercises.

At this stage, you can gradually introduce some more intrusive noises, such as whistles blowing, hands clapping, bells jingling and the vacuum cleaner running. Play with the kittens as you introduce the noise in the background.

How old is this kitten?

assessing kittens

When you rescue a new kitten, you will want to assess her age and general health, and ensure that you are providing age-appropriate care. Keeping a written log will help you monitor the kitten's growth and progress. Every day, make note of her weight, body condition, and behavior to make sure that she's on track for success!

TEENY TINIES The tiniest, most vulnerable kittens require gentle and frequent care.

- pink in color, umbilical cord attached, eyes closed
- 97 degrees; can't regulate temp.

- eyes closed, ears folded, no umbilical cord
- eyes open at 8-12 days

- eyes completely open, blue color
- wobbly on their feet

TEENY WEANIES As kittens age, you'll help them reach important developmental milestones.

- incisors emerging, ears unfolded
- discovering litterbox

- canines emerging
- walking confidently & exploring their surroundings

- premolars emerging
- weaning slowly onto wet kitten food

BIG KIDS CLUB These social, independent, and coordinated kittens are almost ready for adoption.

- molars emerging
- coordinated; like a miniature cat

- all milk (deciduous) teeth have emerged
- transitioning into adult eye color

- once 2 pounds, kittens can be spayed/neutered and placed in their forever home!

Remember that some kittens may reach developmental milestones at different ages, and that's okay!

Litter box training for kittens and cats

When kittens are about four weeks old, they will begin to play in, dig through and explore loose, soft materials such as dirt or litter. As a result of this investigative digging, kittens begin to relieve themselves in these materials. So, kittens do not have to be taught by either their mothers or humans to relieve themselves in soft, loose materials, or to dig and bury their waste. Kittens are simply born knowing how to do it.

It's not necessary to take kittens to the litter box and move their paws back and forth in the litter. Doing so may actually be an unpleasant experience for them, causing them to have some negative associations with the litter box.

However, litter boxes that don't provide an acceptable place to eliminate (from the cats' point of view) may cause cats to relieve themselves elsewhere. That's why it's important to provide a litter box that meets the kittens' needs. You want the kittens to like the box and use it consistently.

Location

Most people want to put the litter box in an out-of-the-way place so they can minimize odors and loose particles of cat litter around the house. Often, the litter box ends up in the basement, possibly next to an appliance on a cold cement floor.

But that type of location is often undesirable to cats. Young kittens may not be able to get down a long flight of stairs in time to relieve themselves. And adult cats new to a home may not remember where the litter box is if it's hidden away in a distant location.

Another thing to keep in mind is that if your litter box is next to a sometimes-noisy appliance, such as a furnace, washer or dryer, cats may become startled when the appliance turns on. This may cause them to associate the litter box with the frightening noise, and they may then refuse to use the box in that location. Also, some cats like to scratch the surface surrounding their litter box and they may find a cold cement floor unappealing.

You can compromise by placing the litter box in a location — such as a closet or spare bathroom — that gives the cat some privacy but is also conveniently located. If you place the litter box in a closet, make sure the closet door is wedged open from both sides to keep the cat from being trapped inside or outside of the closet. If the litter box sits on a smooth, slick or cold surface, consider putting a small throw rug or mat underneath the box. The cats will have something to scratch and less litter will be tracked through your house.

Type and depth of litter

Research has shown that most cats prefer fine-grained litters. Clumping litters are usually finer in grain than typical clay litter. With kittens younger than ten weeks, though, use only non-clumping litter. The reason for this is that very young kittens tend to taste their litter and play in it. If you use clumping litter, the dust from the litter can solidify in their respiratory or digestive tracts and cause fatal obstructions.

Different cats prefer different depths of litter, but most cats don't like litter that's more than about two inches deep. Cats don't choose areas for elimination where they sink into several inches of litter or dirt. It's not true that the more litter you put into a litter box, the less often you will have to clean it. Regular cleaning is essential, regardless of the depth of the litter.

Number of boxes

Try to have at least as many litter boxes as you have cats. That way, no one can be prevented from using the box because it is already occupied. It also keeps one cat from “guarding” the litter box and preventing other cats from accessing it.

Litter boxes can be placed in several locations around the house. This practice helps to train young kittens because there’s always a box nearby that they can get to in time to eliminate.

To cover or not to cover

Many cats don’t show any preference for a covered versus a non-covered litter box. But if a cat is very large, a covered litter box may not allow sufficient room for him to turn around, scratch and dig, and position himself in the way he prefers. It’s better to use uncovered boxes when training kittens because it is easier for them to get into and out of the litter box.

A covered box tends to provide more privacy and may be preferred by shy, timid cats. It’s a good idea to offer both types of litter boxes to discover which one the cat prefers. If you don’t want to buy a covered box in order to find out which one your cat prefers, a litter box cover can be made from an upside-down cardboard box with the flaps and one side cut away.

Cleaning the box

Litter boxes should always be kept clean. Feces should be scooped out of the litter box daily. The number of cats and the number of litter boxes will determine how often the litter needs to be dumped and completely changed. Twice a week is a general guideline, but you may need to change it more or less often, depending on the circumstances. If you notice any odor or if much of the litter is wet or clumped, it is time to change all the litter.

When washing the litter box, do not use strong-smelling chemicals or cleaning products because the smell of vinegar, bleach or pine cleaners may cause the cat to avoid using the litter box. Washing with soap and water should be sufficient. Letting the container air-dry is also a good idea, but it will be necessary to have a back-up litter box while the other one is being cleaned.
